Maine Medical Center
Guideline for the Management of Bleeding on Dabigatran (Pradaxa)

Key Background

- Dabigatran is a factor II (thrombin) inhibitor. As such, replacing clotting factor(s) is not as effective in stopping bleeding as it is in settings with factor deficiency. There is currently no strong evidence that FFP, Factor VIIa, or PCCs can reduce the bleeding induced by dabigatran.\(^1\) [R]
- Fresh frozen plasma will not reverse the anticoagulation effect of dabigatran as the drug will inhibit thrombin in the infused plasma. The prolonged clotting time with dabigatran is a reflection of thrombin (Factor II) inhibition rather than a clotting factor deficiency.\(^6,7\) The role of FFP is in the avoidance of a dilutional coagulopathy following massive transfusion rather than in reversing the anticoagulant effect of dabigatran. [R]

General Care for All Patients

- Hold dabigatran,\(^1,2\) [R]
- Obtain laboratory studies including CBC, aPTT, creatinine, LFTs, INR, thrombin clotting time, fibrinogen activity,\(^1,2,7\) [R]
- Evaluate for anatomic defects explaining hemorrhage,\(^1,2\) [R]
- Use local measures to control bleeding,\(^1,2\) [R]
- Consider the need for surgical intervention, embolization to control bleeding,\(^1,2\) [R]
- Consider the need for Hematology/Nephrology consults.\(^1,2\) [R]

For Patients with Mild Bleeding

- Continue “General Care for All Patients” listed above, and:
- Delay next dabigatran dose,\(^1,2\) [R]
- Discontinue dabigatran treatment if appropriate,\(^1,2\) [R]
- Supportive care / symptomatic treatment.\(^1,2\) [R]

For Patients with Moderate to Severe Bleeding

- Discontinue dabigatran,\(^1,2\) [R]
- Supportive care / symptomatic treatment.\(^1,2\) [R]
- Activated charcoal at standard doses if last dose of dabigatran etexilate within 2 hours,\(^1,3\) [R]
- Maintain adequate diuresis with fluid replacement and hemodynamic support as needed,\(^1,5\) [B]
- Transfuse RBCs as needed to maintain HgB above 8 gm/dl,\(^2,6\) [R]
- If more than 4 units of RBCs are required, transfuse RBCs/plasma 1:1 to avoid a dilutional coagulopathy,\(^8\) [B]
- See also Maine Medical Center Massive Transfusion Protocol,
- Consultation with nephrology for consideration of dialysis.\(^1,5,8\) [B]

For Patients with Severe/Life Threatening Bleeding

- Continue “General Care,” and “Moderate to Severe Bleeding” measures above, and:
- Consider recombinant activated Factor VII (40 mcg/kg), or \(^9,10\) [R]
- As a last resort, consider prothrombin complex concentrate (PCC) (25 units/kg) to help with clot formation at the site of bleeding.\(^9,10\) [R]
- **NOTE:** The strength of the evidence for these interventions is weak and limited.

**Grade B Evidence** = Cohort Study

**Grade R Evidence** = Consensus Statement from Consensus Report or Narrative Review
Supporting Evidence
